INTRODUCTION

We have pleasure in bringing out the second volume of the "Catalogue of Maps in the Bombay Archives". The first volume was published in 1979, it contained the cataloguing of the first batch of one thousand maps. This second volume covers the Cataloguing of next batch of four thousand maps, serially numbered from 1001 to 5000. The maps, here, are numbered according to their accession and not according to any kind of classification or division. The Bombay Archives has a rare collection of nearly ten thousand maps, plans, charts, etc. The third volume, we hope, will cover the cataloguing of the residue of this collection.

A map, as every one knows, is a flat representation of the earth of some part of it with its physical, political or some other indictable features. It is delineated to show the extent and relative positions of geographical features. A map, as we see it today, is drawn true to scale and shows the relative positions of features, exact not only as regards the directions concerned, but as regards the distances as well. In fact the scale is the principal ingredient or the language in which a map is written or read i. e. interpreted. A scale is, however, a considerably later development, progressively realized with the accumulation of geographical knowledge necessitating the representation of a very vast area within a comparatively very small space.

A map is representation of a small or large area of the earth on paper. It may be regarded as conventional picture of the earth's surface, as seen from above to which lettering is added for identification. A map always has some proportion to the actual size of the area on the ground. This proportion is known as the scale of the map and is always given on it.

Maps are classified either on the basis of their scales or on the basis of their content and purpose for which they are required. Based on scales, maps have been divided into four types ;

Cadastral Maps.—The term *Cadastral* is derived from the French word *Cadastre* meaning register of territorial property. They are maps based on the largest scales and are sometimes known as "Plans." These maps are useful for identification of boundries of property, in legal documents, and for detailed issues such as local administration, taxation and the management of estates.

Topographical Maps.—The topographical maps of India are prepared by the department of Survey of India. They are large scale maps but their scale is smaller than that of the cadastral maps. Mainly,

the scale is of one inch, half inch and quarter inch respectively, to a mile. Such type of maps are useful for travellers, motorists, soldiers for war operations and geographers for studying the regional geography of an area in detail.

Wall Maps.—Wall maps are usually drawn boldly so that they may be used in the class rooms. Their scale is smaller than that of topographical maps but larger than that of atlas maps.

Chorographical or Atlas Maps.—Drawn on a very small scale they give a more or less generalised picture regarding the physical, climatic and economic conditions of different regions of earth. The atlas maps are drawn on a very small scale.

Based on the content and the purpose for which they are required maps are divided into :

Physical Maps.—Supply information regarding natural features.

Astronomical Maps.—Show heavenly features.

Orographical or relief Maps.—Depict relief and drainage of the area, i.e. mountains, rivers, etc.

Bathmetric Maps.—Indicate the depth of oceans.

Bathorographical Maps.—Deal with the combination of the above two features.

Geological Maps.—Show rocks, their types and structure.

Climatic Maps.—Indicate sum total of weather conditions spread over a longer period. The data is generally the average for a considerable number of years or months, as the case may be, a climatic map generally shows only one condition, be it temperature, rainfall or any other.

Weather Maps.—Deal with conditions observed at a given time, In India these are prepared twice a day by the Meteorological Department of India, Pune.

Vegetation Maps.—Show distribution of natural vegetation in the area.

Soil Maps.—Show various types of soils covering any given area.

Cultural Maps.—Provide information about manmade features.

Ethnographic Maps.—Show distribution of different races.

Political Maps.—Show political boundaries between the political units, roads, railways, towns and administrative units.

Military Maps.—Show strategic points, routes, battle plans, etc.

Historical Maps.—Deal with past events.

Social Maps.—Deal with social organisms like tribes and races, their religion, language etc.

Population Maps.—Indicate the density of population in the area shown.

Economic and Statistical Maps.—Show centres of agricultural yields quantities produced in different years, trends and direction of trade, export, import etc.

Communication Maps.—Show roads, railways, sea, or routes.

The art of making map has been known to man from the earliest times, but a very few of the earliest maps have survived. The earliest world maps that have survived are copies of those made by Ptolemy in the second century A. D. During the Middle Ages, the Indian sub-continent figured in several general maps prepared by the cartographers of the commercial powers of the Mediterranean. A few Maps prepared by the Moghals and the Marathas have come to light, but they are not of an excellent quality. A more detailed and accurate mapping of India followed the territorial expansion of the East India Company, and it is well known that the present-day high standard in Indian Cartography owes its origin and development, almost entirely to the introduction of western technique in Map making by Europeans.

The first surveyors traversed along roads and rivers with simple instruments and occasional astronomical observations. Work had in general to be confined to the limits of the East India Company's territories, and such methods could give no accurate results. The Maps were admittedly better than nothing but there were vast blank areas which could not be visited.

The earliest attempt at a modern and accurate map of India was that of the French geographer D. Anville, who in 1751-2, compressed into that form all the available knowledge of the time, whether derived from the routes of travellers or from rough coast charts. In this map he also incorporated the work of certain Lamas between China and Tibet and around the Sources of the Ganges, as well as the information derived from early travellers of the eighteenth century in those parts. Major James Rennell, who had served under Clive, made a further advance both by his personal exertions in surveying, continued until 1782, and by the publication of his *Memoir of a Map of Hindoostan*, which first appeared in 1788. His *Bengal Atlas*, based on his own work, was published in 1781, on the scale of five miles to the inch, covering an area of about 27,000 square miles in Bengal, Bihar and the Upper Provinces. The value of this map is now only historical but his large-scale surveys of the Ganges and Brahmaputra are still of interest as showing the change which have taken place in the courses

of those rivers. The method of surveying adopted by Rennell was to fix the positions of a considerable number of stations by astronomical observations for latitude and longitude, and to measure the intervening distances with the chain or with the "measuring wheel". The correct determination of longitudes was his chief difficulty and although he utilized the results of the work of several independent observers at Madras, Calcutta, and elsewhere, his maps, judged by later standards, can only be considered as approximations to accurate cartography. Rennell was certainly the "Father of Indian Geography" and his *Memoir* is a labourous attempt to reconcile a vast array of conflicting geographical data. His field-work was continued in Madras, the Deccan, and Western India by his assistants and successors, Colonels Call, Pearse, Wood, and Reynolds. A materials accumulated, attempts were twice made to compile a general map of India. In 1787 Colonel Call of Madras had nearly completed such an atlas in twenty sheets, but returning home in 1788, he died soon after, and his map was lost. Colonel Reynolds of Bombay completed and sent home a *Great Map of India*, in 1798. It was never published and was, presumably, destroyed on the dissolution of the East India Company.

But at the end of the eighteenth century a man was found in India destined to revolutionize the survey methods then in vogue and to place them on a scientific basis. This was William Lambton then Captain in the 33rd Ragiment, Commanded by Colonel Arthur Wellesley, afterwards Duke of Wellington who had studied mathematics under Charles Hutton. Towards the close of 1799, Lambton, with the approval of his commanding officer, submitted a project for a geographical survey of Southern India to the Governor of Madras. In the following year a more definite scheme was called for and Lambton's reply is the earliest document in the records of the Trigonometrical Branch of the Survey of India. In this letter he points out the fallacy of the systems of survey then followed in India, which ignored the curvature and form of the earth. He advocates the measurement of a base-line as a "datum", triangulation and its correct computation; measurements to determine the length of a degree on the meridian and perpendicular; and he refers to pendulum experiments and Newton's investigations regarding the figure of the earth. He proposes to carry out his work with a view to the requirements of geodesy and to follow the method adopted in the English Ordnance Survey which had been commenced by General Roy in 1784. Lambton's project was favourably received, and he commenced work in 1800, the instruments available being, a steel measuring-chain of 100 feet divided into forty links of $2\frac{1}{2}$ feet each, a 5 feet zenith sector, and a transit instrument by Troughton. The first base of 7.43 miles was measured near Bangalore with the chain; and for the next two years Lambton was employed in fixing, by triangulation, a large number of points in Mysore, to serve as a basis for the topographical survey then in progress under Colonel Colin Mackenzie. April 10, 1802,

is the date of the actual commencement of the Great Trigonometrical Survey of India, when Lambton, with new instruments, including a 36-inch theodolite, started the measurement of a base-line near Madras for the determination of the length of an arc of meridian. Between 1800 and 1823 Lambton was continuously employed, practically single-handed, on triangulation; and during that period he threw a network of triangles, verified several chain-measured base-lines, over the Peninsula south of latitude 78° N., omitting the plains of Tanjore. He also carried a chain of principal triangulation approximately along the meridian 78° E. from Cape Comorin to near Ellichpur, through thirteen degrees of latitude; and this chain, which now extends through twenty-two degrees of latitude from Cape Comorin to the Himalayas, is known as the Great Arc Series. Lambton's series of triangles along the Parallel 13° N., from Mangalore to Madras, was the first attempt at a longitudinal arc. By its means he detected an error of 40 miles in the breadth of that part of the Peninsula as laid down by Rennell, and found great inaccuracies in the positions of the chief towns.

In 1818 the Trigonometrical Survey, which had up to that date been under the Madras Government, was transferred to the immediate control of the Governor-General, and the records and plans were removed from Madras to Calcutta. Colonel Lambton died in 1823, aged sixty-seven, at Hinganghat, 50 miles from Nagpur, engaged to the last on the prosecution of the great work he had initiated. His death marks the close of the first period of the Trigonometrical Survey, as his work has little in common with subsequent operations. For geodetic purposes it has shared the fate of similar contemporaneous operations in Europe, since all the measurements have had to be revised as instruments and methods improved; but for geographical requirements, as bases for topographical and other surveys, it is still, and will remain, most valuable.

Lambton was succeeded in the charge of the Great Trigonometrical Survey by Captain (afterwards Sir) George Everest of the Bengal Artillery. In 1830 Captain Everest, who had spent five years in England studying the best methods of prosecuting the survey, returned to India, bringing with him new instruments of the latest pattern and Colby compensation bars for the measurement of base-lines.

Sir Andrew Waugh, who became Surveyor-General and Superintendent of the Trigonometrical Survey in 1843, on the retirement of Sir G. Everest, designed a great quadrilateral figure of chains of triangulation, which was to enclose and intersect the lately conquered territory of the Punjab.

General J. T. Walker succeeded Sir Andrew Waugh as Superintendent of the Trigonometrical Survey in 1861. When the two offices held by the latter were separated, and Colonel H. L. Thuillier was appointed Surveyor-General.

The Magnetic Survey of India and Burma, now being undertaken, was initiated by Professor Rucker, F. R. S., through the Royal Society in 1897. The work was commenced in 1901, and completed about 1907.

Prior to the year 1800, topographical work was as a rule confined to the results of road and route sketches of the roughest description, though Rennell had produced a detailed survey of the Ganges and Brahmaputra rivers. Early in the nineteenth Century Colonel Colin Mackenzie introduced, in Southern India, a system of detailed topographical survey, based on a triangulation of some sort; and while Lambton was engaged on his work in Madras, Mackenzie had independently measured, bases in Mysore and connected them by triangulation.

The revenue Surveys, which form the basis of all settlement operations and of the entire fiscal administration of the country, were commenced as early as 1922, west of the river Juma, in the Delhi, Panpat and Rohtak Districts. Measurements were made of the boundaries of estates and villages by means of the theodolite and chain, and the work was based upon the traverse system. The topographical details on these old surveys appear to have been well executed, but a retrograde step was introduced after a conference of surveyors held at Allahabad in 1834 by order of Lord W. Bentinck.

In the Bombay Presidency, the revenue Surveys date from 1836, and their original design was due to Sir George Wingate. They were not based on triangulation, and were chiefly executed with the chain and cross staff. As in Madras, they had been carried out by a local Revenue Survey Department which worked independently of the Survey of India. The field operations of the village survey were conducted by native measurers, whose work was supervised and tested by a European assistant. The revenue assessment, which in Bombay had been carried out by the Survey Department, was based on an elaborate system of classification of the nature, depth and productive capability of the soil in each field, and the character of the water-supply available. This revenue survey though amply fulfilling the administrative requirements of the Settlement officers, was not conducted with view to its possible utility for the compilation of topographical maps, and hence topographical surveys of the whole of the Bombay Presidency became necessary. These were carried out, chiefly on the 1-inch scale, by several parties of the Survey of India at various periods between the years 1864 and 1896.

The principal publications of the Indian Surveys were however, standard sheets on the scale of 1 inch to the mile. These were complete for considerable portions of India proper, but new editions were continually brought out as materials became available from fresh surveys.

A large number of these sheets, such as those of the Bombay Presidency, Mysore, and a considerable part of Burma were reproduced from topographical surveys carried out on the 1-inch scale, which those of the Punjab, the Central Provinces, and parts of the United Provinces were compilations or reductions from the large-scale cadastral and revenue surveys.

Shri (now Dr.) Sanjiv P. Desai, in his Introduction to the first volume of this Catalogue has aptly given a brief history of the survey operations in the Bombay Presidency till early 19th century. I will not repeat the same here, but I will supplement the information derived from the records in Bombay Archives. I thank Dr. Desai for furnishing me with this information.

Col. H.L. Thuillier, Surveyor General of India submitted his report, on 7th August 1869, on the then *Existing State of geographical materials connected with the Bombay Presidency* ; Ever since the abolition of the Office of Deputy Surveyor General at Bombay and Madras, in the year 1833, the interests of Geography for both those Presidencies had been in total abeyance. The old records of the Bombay Presidency were made over to the Chief Engineer's Office, and all Topographical or important surveys having likewise been in abeyance since that period, and only a certain portion of that Presidency having been previously surveyed in a manner fit for incorporating the materials into the sheets of the Great Atlas of India, it follows that the then condition of the Western Presidency remained in a most blank and unsatisfactory state with all the Northern and Western Districts totally unrepresented, and the several sheets of the Atlas of India, (No. 11, 12, 13, 21, 22, 23, 35, 36, 37.) left unpublished up to 1869.

The Madras Presidency having had the benefit of the earlier surveys all over the Southern Peninsula, the sheets of the Atlas were published almost of the entire Presidency long ago, and consequently that Presidency had not suffered so much from the dearth of good maps, and fair geographical knowledge of the several Districts and Divisions, but not so with Bombay, which had literally stood still in respect to good surveys, and to intelligible or useful maps on adequate scales, for a period of nearly 40 years ; and it was difficult to understand, how, with the exigencies of the Public Service, the demands for Railways and other Public Works, which had of late years been so greatly on the increase, the several administrations had been able to carry on their duties as they had done.

A minute Revenue Survey of the several Collectorates of the Bombay Presidency had been under execution for several years past, and it was supposed that this operation had afforded the information necessary for general Geographical purposes, but this great and expensive operation of the cadastral or revenue measurement of fields in Bombay, had

not been generalised and reduced into a convenient scale, on a proper basis, and had therefore contributed nothing whatever to geography, and the object being apparently solely for assessment purposes, the true and real interests of geography had been lost sight of or postponed, and therefore that no reliable district maps on the Geographical or reduced scale, fit for incorporation in the Atlas of India, and for combination and engrafting on the Great Triangulation, had been produced from that operation, till 1869.

Suffice it to say that none had ever reached to the Survey Department which was the only Geographical depot for all India, and for the whole period above referred to no contributions of any sort had ever been received into that Office from Bombay, and none had ever been sent to the Geographer at the India Office. The Quarter Master General's Map on the small scale of 20 miles to the inch for the whole Presidency, was all that was available of nearly one half of the entire area, and the utmost inconvenience had resulted from the absence of Maps of much of the important portion of Bombay Presidency, even on tolerable scales and however rough and approximate.

The line of the G.I.P. Railway existed on the Maps of India South of the Tuptee River, solely by guess, the position of Bhusawal junction was not known within a large quantity, and from thence through Khandesh to Bombay, there was not reliable authority for the Topography or positions of places. It was the same to the north with the Baroda and Ahmedabad line.

Since Col. Thuillier's connection with that Office in 1847, he experienced the atmost drawbacks and inconvenience, from the want of proper materials of the Bombay Presidency, to assist them in their numerous compilations of maps of those parts of India, which had not till then, come under the regular Survey operations, and which for military and other preliminary purposes, it was so absolutely necessary for that Department to issue, as 'avant couriers', to the Engraved Sheets of the Atlas; it was with no little satisfaction that Col. Thuillier received the memorandum on the subject with the note of the Secretary to the Bombay Government, dated the 4th June 1869, and found that the subject had at length attracted the notice of competent authority, to which his attention was invited, and he thought it was not difficult to show, that the time had arrived for remedial measures being at once taken.

There were two questions connected with the above subject, first: the utilisation and preparation of existing inferior and old materials scattered wherever supposed to exist by means of a competent Departmental Officer, who might have also local experience and knowledge, to serve immediate purpose, and as a *pis aller* until accurate surveys could be made worthy of the times, and adopted for all the important purposes of Government of that time, and secondly, the acceleration

of the professional, or Topographical Survey of the Bombay Presidency (which might be said to have only just commenced,) by the increase of the number of Establishments, gradually to be expanded from the Department generally, as circumstances would permit, to fill up those areas or Atlas Sheets which were then absolutely blank and lying north of the parallel of 20° North Latitude.

The following information had been gleaned from the records of the Survey Office, as to the precise value, or quality of the old maps of the Bombay Presidency, and as to the extent of geographical information available.

Sir Andrew Waugh in his Parliamentary Report, dated 20th October 1850, which was laid before the House of Commons in April, 1851, in reporting on the Maps of the Bombay Presidency, remarked as follows, on the maps of Gujarat, Cutch and Kathiawad, 1809 to 1841, "These are compass and perambulator Surveys, with detail not based on triangulation of the Western Presidency. When connected with the Great Trigonometrical Survey of India, they may be turned to good account. No field book, memoir or journal is forthcoming".

Of the Revenue Surveys of Ahmedabad, Broach and Surat he remarked that, they were made prior to 1832, but that as the Maps never reached that Office he could not pronounce any opinion on them.

Of the Surveys of Konkan (Northern) and Sattara (1833) he stated, "These Surveys comprising in detail all Geographical information are based on good triangulation work".

Of Kolhapur, Dharwar and Southern Konkan, he said that the Surveys had been "executed in detail, but grounded on imperfect triangulation".

Of Khandesh and the northern portions of the Nizams and Peshwas' Dominions, there was a fairly reliable map compiled from the Surveys of Captain John Briggs and Captain Dehaviland (1806 to 1822), but a great portion of the map depended on routes and bearings. The Southern portion was corrected to correspond with Lieut. Shortrede's triangulation in Konkan.

In addition to the above there were several very rough Lithographed maps of Districts and Collectorates, Jagheers, Khandesh etc. in the Bombay Presidency, but without exception these were so very badly drawn, and the Topography was so old, meagre and ill-executed, that the maps were of very little or of no use.

The Surveys from which all the above maps were obtained, extended from 1806 to 1841, and from some of these materials were compiled the published Atlas Sheets (Nos. 24, 25, 26, 27, 36, 39, 40, 41, 42, 55,

(x)

INTRODUCTORY

56, 57, 58) of the Bombay Presidency. The Geography of the best of that maps could only be said to be fairly reliable ; only of Northern Konkan and Sattara were the details based on good triangulation. Of the later, Surveys there were no maps, and as they appeared to have been of a desultory and unconnected character conducted by Officers of the Quarter Master General's Department, for Route purposes only, and not based on any Triangulation, they were not acceptable as furnishing suitable materials for the great Atlas of India, however useful they might be for general purposes. Some of those already published were highly defective in certain places, with blanks here and there and showed palpable evidence of requiring new Topography.

This was the position of the geographical materials connected with the Bombay Presidency, when Col. Thuillier wrote his *Memorandum* in 1869, (Revenue Department, Vol. No. 28/1869, pp. 337-342). Col. Thullier made many suggestions and propositions in connection with the survey of the Presidency. In his letter dated 22nd February 1871, he wrote :

With regard to the Bombay Presidency, we have there neither proper professional surveys, nor published atlas sheets, nor any other sort of reliable map, for a large portion of the Northern Division or Districts. There is consequently but one remedy for this state of things, and that is the early employment of competent and experienced survey parties to take up the Non-Regulation or Native States by the usual topographical system of survey on the one-inch scale, as advised in my memorandum submitted to the Bombay Government (on 7th August 1869) and likewise by a Revenue Survey party or two, on the Bengal model, capable of combining Revenue with Topographical Survey delineation for any regulation or regulation of revenue -paying districts not at present occupied by the Bombay Revenue Settlement Commissioner's establishments.

This may be done next cold season, and the required field parties may be expanded gradually from the existing machinery employed in this Presidency, if timely orders are given for the purpose. By restoring to the Department the executive parties abolished under the financial pressure last year, a fair commencement might be made in the unallotted districts of the Bombay Presidency ; and to my mind it is obvious that, until the imperial system of survey, as prosecuted by this Department, is extended to Bombay, no progress whatever will be made towards the geographical development of that important part of India which has been shown in the memorandum above quoted to be absolutely bare and destitute of all surveys and maps.

The extension of Topographical and Revenue Survey parties into Bombay, as above recommended, requires no addition to the administrative superintendence. Such surveys can be regulated and controlled

by the present officers in charge of the Topographical and Revenue Branches of this Presidency respectively ; and under the general direction of the Surveyor General the same uniform imperial system can be provided for, and the work made to advance on authorized rigorous principles.

It has been shown in the Annual Administration Reports of the Topographical and Revenue Surveys that "the work in hand and before us in this Presidency is very extensive, more than ample to occupy all the existing executive parties for many years to come. All the available parties which may finish their work in Oudh, in the Lower Provinces of Bengal, or in the Punjab, will, I presume, be required for the North-Western Provinces, a proper survey of which having been authorized has only just commenced, and where only one-and-a-half parties are already engaged. It would, therefore, be many years before any of the existing establishments could conveniently be found to quit very important and urgent work in hand and in prospect on this side of India ; and therefore to initiate any thing practical and useful in Bombay, we must draft new parties by degrees from the available machinery at work here, filling up the vacancies thus caused by new appointments, and carrying on the duty of training new hands as fast as possible.

It is not practicable either to stop operations once commenced, or to take off survey parties from districts which are urgently demanding proper survey, as in the North-Western Provinces.

When the views of the Government on the general question are given definite estimates and proposals can be made for the inauguration of new portion and their precise sphere of action ; but I may state briefly now that the average cost of a Topographical and Revenue Survey Party, is Rs. 58,524 and Rs. 67,000 respectively.

The Topographical Party should commence on Khandesh, which is in immediate contact with the districts and provinces now in hand or just completed a great advantage as regards systematic and continuous procedure for filling up the sheets of the general atlas. This description of survey on the one-inch scale is best adapted to the hilly and rough nature of Native or Non-Regulation British States, and may also be sufficient for those districts not absolutely champaign, where the measurements of fields have already been carried out by the Settlement Officers ; but where no reliable data and maps are forthcoming fit for geographical purposes.

With respect to the utilization of the forthcoming or available material of various kinds in the Bombay Presidency, with a view to the preparation of preliminary rough maps on very small scales for immediate purposes. I fear nothing, under the recommendation already made,

will be of any avail. The present proposal, in fact, amounts to performing the duties of a Surveyor General's Office for Bombay the same as carried on here, but without the absolute means or any establishment for the purpose. An attempt can be made in my own Office to facilitate the object as far as practicable, with reference to other more important and constantly growing demands on my staff from the enormous amount of current surveys executed annually ; but in the absence of a constituted competent officer for such a purpose who might be able to effect something on the spot, this Office can scarcely except to compile maps from such incongruous and unsatisfactory data, within a reasonable time, to supply the wants of the extensive blanks referred to in my memorandum.

It appears to me that nearly half a century having passed away in the attempt to do something for these Bombay sheets of the Atlas of India without a Deputy Surveyor General at Bombay, nothing of any value is likely to be effected in this way now, except by a competent officer, devoting his time and attention to a duty which will be both difficult and tedious.

But without proper and adequate surveys there is, in fact, no royal road to the geography or correct topographical delineation and representation of the Bombay Presidency than there is to any other part of India or other countries ; and Bombay having been destitute of such professional surveys for so long a period seems eminently entitled to possess them worked on a correct basis under competent management.

The only true specific, therefore, is in the early appointment of efficient professional survey parties for the unsurveyed portions of the Bombay Presidency, which may commence to fill up the unseemly and long standing blanks in the most important parts of that Presidency." (Revenue Department, Vol. No. 35/1871, pp. 282—284).

The three Survey branches, Trigonometrical, Topographical and Revenue, formed at different dates, were at first virtually separate departments, each with its own superintendent and distinct cadre of officers and establishment of European and Native surveyors. In 1878 the three branches were amalgamated under the designation of the Survey of India, whose officers were to be available for any description of survey work that might be required of them, and were all placed under the orders of the Surveyor-General.

In 1904 a Committee was appointed to report on the state of the maps in each province, and the measures required to bring them up to date. This Committee reported in 1905. Among the more important recommendations were : (1) that the preparation of a modern map of India on the scale of 1 inch to the mile should be at once be undertaken according to a definite programme, by which fifteen topographical

field parties would be employed and the whole work would be completed in twenty-five years, and further that the scale of survey should generally be at least double that of publication ; (2) that for the production of this map an improved process of heliograph should be employed a few selected standard sheets being engraved on copper ; (3) that the Atlas of India sheets should be superseded by 'degree' sheets on the 1/4 inch scale, to be engraved on copper ; (4) that, in place of the 1/16 inch Provincial maps, a general map of India on the international scale of 1 : 1,000,000 should be prepared and engraved ; (5) that the staff of the Imperial service for trigonometrical and topographical work should be increased from forty to seventy officers ; (6) that, in place of the existing Provincial Service, a new Provincial Service should be established on better pay, and another Service formed intermediate between this and the present Subordinate Service, one quarter of the appointments in the former and one-half in the latter being given to natives of India ; (7) that cadastral and other large-scale surveys should be left entirely under the control of Local Governments, who should provide for the expense of the work and also for the production of the maps ; (8) that village boundaries should not be shown on the ordinary topographical maps, but that if these are required for administrative purposes, a special edition showing them should be issued under certain conditions ; and (9) that the cost of special forest surveys, when required, should be debited to the Forest Department.

As a matter of fact, the preparation of the maps undertaken by the Survey of India was then a continuous scheme and the maps prepared at regular intervals by the then Survey of India were not only comprehensive and illustrative but fairly reflected the Indian Sub-Continent in all its resplendent geographical potentialities. These maps prepared over a period of 100 years during the British Rule have not lost their utility but on the contrary provided fairly useful guide to the planners of modern India.

The large bulk of the map collection catalogued in this Volume consists of Survey of India maps. Most of them cover Bombay Presidency, Gujarat and Sind. Other maps include Berar, Central Province, Upper Province, Bengal, Punjab, etc. Other series of maps included here are form Indian Atlas, Topographical Surveys and particularly Deccan Topographical Surveys as well as Konkan Topographical Surveys.

A large number of maps catalogued in this Volume pertain to Bombay City and Island. These are more than 560 maps. Almost all areas of the Bombay City have been covered by these maps, e. g. Fort and Esplanade (2622),* Fort South (2892-93) ; Fort West (3460), Bhuleshwar (1300, 1394, 2673, etc.), Girgaum (1299, 2147 etc.) Mazagaon

*The figure in brackets denote Accession Nos. of maps.

(1301), Byculla (1387), Taddeo (1389), Worli (1554) ; Seweri (1564—68), Dadar (2940, 2941, etc.) Matunga (1191-92) ; Mahim (1326), and so on. Mostly these areas were surveyed in about 1869-70 and corrected 1872. There is a plan of land below High Water Mark between Seweree and Mahim, drawn in 1845 (3065) ; Among the recent maps, there are plans of the Vile Parle and Santa Cruz Town Planning Schemes (4289, 499, 500). There is a map of Fort George in this Collection (2588),. The area is shown South of Boree Bunder (now Victoria Terminus of Central Railway). We know that the most of the area south of V. T. area is since olden days known as "Fort". Formerly, Fort George stood there, on the ruins of the old Fort George, an European Hospital was erected, to which Lord Reay, on laying the foundation stone, in February 1889, gave the name of St. George's Hospital. It may be of interest to note that this Hospital now stands in memory of the Fort George of the old Bombay City and Island.

The most of these Bombay maps belong to the 19th Century. No. 2609 is a Map of Bombay, surveyed by the Collector in 1926. A very few maps belong to the 18th century. There is a map of the survey of Uran Island (Spelt as "Ooran", also known as "Caranja" Island) of the year 1774 A. D. This is the oldest Indian map in the collection. The East India Company captured Karanja Island from the Marathas in 1774, and established a Residency at that place. This map seems to be prepared before regular surveys were undertaken. This is a printed map. There is another Chart showing part of the Coast of India and Guzarat from a Survey made by order and at the expence of the East India Company, by John McCluer (No. 2848). The same McCluer had surveyed Persian Gulf in 1785 and his Chart of the Persian Gulf from Muscat to Bushire is at No. 3365. It may be noted here that John McCluer of the Bombay Marine, surveyed Western Coast of India during 1786—90 and published his 'Account of the Navigation between India and the Gulf of Persia' in 1786.

Other maps belonging to the same period pertain mostly to countries outside India. For example, there is as a Plan of Lampan Bay on the East Coast of Luzon, surveyed by Manuel Galves in 1754, (3387). Other maps are of Bay of Calapan on the northern coast of Mindoro (3884), the Kismis Channel in the Gulf of Persia (3385), plan of the Chief Ports on the Coast of Ylocos in Luzon (3386), Plan of Sorsogon Harbour on the South-East part of Luzon (3388). All these maps were printed and published by A. Dalrymple in 1774.

Besides Indian Surveys, there is a large number of maps belonging to the countries beyond Indian boundary. Most of them are from the countries in the Middle East. They are part of the South Coast of Arabia, surveyed by Capt. Hairies in 1839 (2715), Plan of Mocha to Sanna, prepared by Asstt. Surgeon J. H. Hulton and C. Jacruttendon of Indian Navy in 1836 (2847). This is a manuscript map. Map of the Amir of Duala's territory showing the boundary lines claimed

by the British and Turkish Commissioners respectively (2888), Map of the Road from Tehran to Bushire, showing the direction and construction of the Anglo-Persian Telegraph, surveyed by Capt. O. St. John and Pierson in 1871 (1890), Chart of the Coast of Persia from Kooe Mubarrak to Krottohey, surveyed by Commr., G. B. Brucks and Lt. S. B. Haines in 1861 (3204), Map of Country around Aden, Arabia (3200), Map of Aden Survey, 1893 (3897), Map of Arabia and Persian Gulf (4161) : Survey Map of Cyprus, 1885 (3037), Map of Red Sea, 1830—34 (3524), Map of Persia (3800), Sketch Map of Ghazni and surrounding Country, 1880 (1663), Map of Indian Ocean, Suez to Penang, including Zanzibar and Mauritius, 1881 (3060), Map of Babylon, Elheimer and Birshimrud, 1855 (3195), Sketch of the Countries between Hindustan and the Caspian Sea, 1873 (3432, 3739), Map of Persia and Afghanistan (3699), Route to the Ruins of Nakab Al Hajar on the Southern Coast of Arabia (3335), etc.

Several maps in this collection show a number of countries other than India, e. g. Abyssinia, Aden, Afghanistan, Arabia, Asia-Minor, Bagdad, Bluchistan, Baluchistan, Berberah, Bokhara, Bunder Abbas, Burma, Cabul, California, Caspean Sea, Central Asia, Ceylon, China, Cyprus, Egypt, Fars, France, Gulf of Oman, Heart, Iran, Khelat, Nubia Moche, Mauritius, Mesopotamia, Nepal, Nicosia, Persia, Subaiti Country, Tehran, Tigris, Yemen, Zanzibar, etc. There is a Map of China Coast and Rough Sktech of the Provinces, lying between Canton and Paking, compiled and drawn by J. O. N. James, Surveyor General of India, in November 1859, (3725), Map of Bhutan with the Bengal Dooars (3722) was surveyed by H. M. Smith, Surveyor General in July 1865.

Sind Province was a part of Bombay Presidency for some time. There are several Sind Surveys in this collection. There are maps and sketches of Karachi Harbour (4252), Karachi Cantonment (4253), Canal Map of Sind (3398), Karachi Water Supply, 1874(2810), Sind Revenue Survey, 1874 (2809) and several maps of different districts in the earstwhile Sind Provinces. There is a Map of India West Coast Karachi to Vengurla (Ratnagiri Dist.) compiled from the Survey of Commissioner R. Ethersey and A. Grieve, 1876 (2821) ;

No. 2411 is a Map of Kashmir, Ladak and Little Tibet and of the countries between the Sutlej and the Ozus. Chiefly from the Surveys of G. T. Vigne, Lieut. I. Wood, Major R. Leech, Bombay Engineers, Lt. Col. Neil Campbell, Quarter Master General, Bombay Establishment and Lieut J. Anderson and H. M. Durand of the Bengal Engineers, compiled by order of the Court of Directors of the East India Company by John Walker, Geographer to the East India Company, in November 1842. This is a printed map and it has been published in our earlier publication *Maps of India 1795, 1935* (Edited by Dr. B. G. Kunte, Bombay, 1978).

There are a few maps of the forts and strongholds in this Collection. Two Plans of the Hill fort of "Samunghur" are at Sr. Nos. 3434 and 3435. The Fort Samangad is $3\frac{1}{2}$ miles south of Gadhinglaj in Kolhapur District. The fort has been surveyed in October 1844, during the famous Gadkari rebellion in that territory. The fort was captured by the British troops under Delamotte on 13th October 1844, and was dismantled afterwards. This is a manuscript map.

At Sr. No. 3458, there is a Raugh Isometrical Drawing of the front of the proposed Fort at the Sungum (in Poona) drawn by Capt. G. Close, on 4th September 1859. This drawing is also a manuscript. The proposed structure did not come into existence.

Map of Worli Fort (Bombay) drawn in 1872 is at Sr. No. 2936. There are plans of the other forts outside the Bombay Presidency. They are plans of the Hill fort of Kishungurh, 1862 (3202), Plan of the Hill fort of "Bhynsrorgurh" (2408), Plan of the Hill fort of Kelwa in Meywar (2409); Plan of "Mhey Sind" fort in Holkar's territory (2886), Plan of the Small fort of Badami, before and after demolition (2888), Plan of a portion of the large fort of Badami (3130), etc. There is a map of Fortress of Kars on the frontier of Asia Minor (2915).

There are some Military Maps in this Collection. The noteworthy among them are: Disposition map of the Bombay Army, 1874 (2796), Disposition map of the Bengal Army, 1877 (2787), Military map of Hazara, 1848—55, (No. 4314) etc. A few Maps relate to the Franco-German War. This was caused by the rival pretensions for European leadership of the French Second Empire and the Prussian-dominated North German Confederation. The French declared war on July 19th, 1870. The main French Army under Macmohan received a Series of defeats along the eastern frontier throughout August and was forced to capitulate at Sedan on September 1st, Emperor Napoleon III himself being captured. With the fall of Paris, peace talks began and terms were finally accepted on March 1st, 1871, which were incorporated into the definitive Treaty of Frankfurt, May 10th, 1871. There is a map of the seat of war between France and Germany, Photozincographed in Photozinc Press, Poona, 1870. The other Maps in our collection describe the Battle of Vionville Mars La Tour (2729, 2730), Plan for the Battle before Le Mans on 10th, 11th and 12th January 1871 (2732) Plan for operations on South-west Theatre of war (2733), etc. There is also a plan of the defences of Sevastopol with the lines of attack of the Allied Armies, previous to the final assault, Surveyed by Major General Sir Henry Jones (4152).

Several items in this collection are Plans of Railway lines in India, e.g. Southern Maratha Railway (4202-4224, 4452, 4471, 4507, 4518, etc.) Rajpipla State Railway (4425-4444), Barsi Light Railway (4472—96), Pakhrayan Ooriyah Light Railway (4497—4506), Morvi Railway (4793—4992—4993), South Indian Railway (4528—4538, 4541—4542),

A small map unit consisting of one Assistant Archivist and two clerk-typists was created in October 1976 in the Department of Archives, when Shri (now. Dr.) Sanjiv P. Desai was appointed to officiate in the post of Assistant Archivist. He was succeeded by Sarvashri V. T. Gondil, R. S. Pednekar, P. S. Khobreakar, A. E. Sonawane, Shrimati A. P. Lopez and Shri A. K. Kharade. The cataloguing of these maps has been done under their supervision, while actual cataloguing was done by Smt. A. D. Bhiwandkar, Shri Yatin Prabhavalkar, Shri P. L. Gore, and Shri S. S. Chalke. Press copy was typed by Shrimati N. U. Sawant, Shrimati V. V. Vartak, Smt. N. U. Kulkarni, Shri R. S. More, Shri P. V. Vanjare, Shri F. R. D'souza and Shri Ashok Kamble under the supervision of Shri A. K. Kharade. Dr. S. P. Desai, Publication Officer, with the help of Shri C. S. Chavan, Archivist and Shri R. R. Pednekar, Research Assistant, suggested some corrections in the press copy. Sarvashri R. S. Pednekar, C. S. Chavan, (Archivists), R. R. Pednekar, (Research Assistant), A. N. Patil, (Chemist) corrected the proofs. I am thankful to all of them for their valued participation in the compilation of this publication.

I am also thankful to Shri R. B. Alva, Director, Government Printing and Stationary and Shri B. B. Bracken, Manager, Government Press, Nagpur and the other technical and non-technical staff associated with the printing of this volume for expeditiously bringing out this publication.
